Fact Sheet
European Union Digital Product Passport (EU-DPP)
Version: July 2027

DPP Timeline

Phase	Start Date	Expected Timeline	DPP Status	Main Requirement	Industry Impact
ESPR Enters into Force	18 Jul 2024	Ongoing	Regulation in force	The Ecodesign for Sustainable Products Regulation (ESPR) becomes legally effective, establishing the regulatory framework for Digital Product Passports (DPPs) and empowering the European Commission to introduce product-specific requirements through Delegated Acts.	Companies exporting products to the EU should begin evaluating product data availability, traceability systems, and digital readiness to prepare for future DPP obligations.
DPP Registry Operational	19 Jul 2026	Ongoing	Confirmed	The European Commission establishes the Digital Product Passport Registry and supporting digital infrastructure to enable interoperability, unique product identification, and secure exchange of product information across the EU.	Businesses should begin aligning their IT systems with DPP requirements and prepare for integration with the EU digital infrastructure for product data management.
Initial Product Requirements	From 2027	Product-specific implementation	Progressive rollout	The first product-specific Delegated Acts are expected to introduce mandatory Digital Product Passports for priority product groups such as batteries, textiles and other selected sectors. Each Delegated Act will specify the required product information, data format and compliance obligations.	Manufacturers, suppliers and exporters in the affected sectors must collect, validate and maintain the required product data and establish processes to generate compliant Digital Product Passports.
Sector Expansion	2028–2032	Progressive rollout	Future implementation	The DPP framework will gradually expand to additional product groups identified under the ESPR Working Plan. New Delegated Acts will introduce sector-specific information requirements and compliance timelines.	An increasing number of manufacturers and supply chain partners will be required to implement DPP systems, improve product traceability, and enhance sustainability data management across their operations.

Digital Product Information Ecosystem	Ongoing	Continuous	Long-term implementation	Digital Product Passports become an integral part of the European product information ecosystem, supporting continuous updates throughout the product lifecycle and enabling data sharing among manufacturers, regulators, customs authorities, recyclers and consumers.	Organisations will benefit from improved regulatory compliance, enhanced supply chain transparency, stronger circular economy practices, and increased confidence among customers and business partners while maintaining long-term access to the EU market.

Product Groups Expected to Require Digital Product Passports (DPP)

Product Groups Priority	Expected Timeline	Scope of Products	Key DPP Focus	Industry Readiness Priority
Textiles, Garments & Footwear	2027	Clothing, fabrics, footwear, fashion accessories and textile products placed on the EU market.	Fibre composition, recycled content, hazardous substances, durability, repairability, manufacturing information and end-of-life guidance.	Very High
Iron & Steel	2028	Iron, steel and finished steel products including structural components, sheets, bars and tubes.	Material composition, recycled content, carbon footprint, manufacturing process and product traceability.	Very High
Furniture	2029	Indoor and outdoor furniture manufactured from wood, metal, plastic or composite materials.	Material sourcing, repairability, durability, recyclability and environmental performance information.	High

Tyres & Rubber Products	2029	Vehicle tyres and selected rubber-based products.	Material composition, recycled content, product performance, sustainability information and end-of-life management.	High
Leather & Leather Products	2029	Leather goods including footwear, bags, accessories and other leather products.	Material origin, chemical use, manufacturing traceability, durability and recycling information.	High
Detergents & Cleaning Products	2029	Household and industrial detergents, cleaning agents and related products.	Product composition, chemical ingredients, environmental impact and safe disposal information.	Medium
Paints, Coatings & Varnishes	2029	Decorative paints, industrial coatings and protective finishes.	Chemical composition, hazardous substances, environmental performance and disposal guidance.	Medium
Lubricants & Greases	2029	Industrial lubricants, automotive lubricants and greases.	Product composition, environmental impact, safe handling, traceability and end-of-life management.	Medium

Aluminium	2030	Primary and secondary aluminium and finished aluminium products.	Material origin, recycled content, manufacturing emissions, resource efficiency and product traceability.	High
Petrochemicals & Basic Chemicals	2030	Basic chemicals, intermediates and petrochemical products used across manufacturing sectors.	Chemical composition, sustainability information, carbon footprint and supply chain traceability.	Medium
Energy-related Products	2030	Products already covered under Ecodesign requirements, including appliances and equipment with energy performance obligations.	Energy efficiency, environmental performance, repairability, spare parts availability and lifecycle information.	High
Information & Communication Technology (ICT) and Electronics	2032	Computers, mobile devices, consumer electronics, networking equipment and other ICT products.	Product specifications, repairability, software support, critical raw materials, recycled content and end-of-life information.	Medium to High

Digital Product Passport (DPP) Implementation Roadmap

Phase	Timeline	Implementation Stage	Key Features	Expected Industry Actions

Phase 1 – Minimal & Simplified DPP	2027	Initial deployment of Digital Product Passports for priority product groups.	Focuses on establishing the basic Digital Product Passport by introducing essential product identification, material composition, recycled content, hazardous substance information, supply chain traceability, and product recyclability. The objective is to create a harmonised and interoperable foundation for DPP implementation across the EU.	Companies should identify applicable products, establish digital product records, collect mandatory product information, assign unique product identifiers, and begin integrating DPP capabilities into existing business and IT systems.
Phase 2 – Advanced DPP	2030	Expansion of DPP requirements with more comprehensive sustainability and lifecycle information.	Builds upon the initial DPP by incorporating additional environmental performance indicators, carbon footprint, durability, repairability, maintenance instructions, conformity documentation, and more detailed supply chain information. Greater interoperability and data sharing across stakeholders are expected.	Businesses should strengthen product data governance, improve traceability across multiple supply chain tiers, integrate sustainability reporting systems, and automate the exchange and maintenance of Digital Product Passport information.
Phase 3 – Full Circular DPP	2033 and Beyond	Mature Digital Product Passport ecosystem supporting the circular economy.	The DPP evolves into a comprehensive lifecycle information system covering product design, manufacturing, distribution, use, repair, refurbishment, reuse, remanufacturing, recycling and end-of-life management. Information can be updated throughout the product lifecycle and shared with manufacturers, consumers, repairers, recyclers, customs and market surveillance authorities through controlled access.	Organisations should operate fully integrated Digital Product Passport systems that support continuous lifecycle data management, circular business models, regulatory compliance, resource efficiency, and transparent information sharing across the entire value chain.
